

## Series #3 recap: Cloud security— Landing zone

### What

- An **Infrastructure-as-code template** with embedded security for day-1 compliance for various workloads, such as

web app  mobile app 

internal portal 

financial systems  etc.

- A **vending machine** for your business to choose from, which ensures no workload deployment that would violate your organization security policies

### Why

- Development and deployment of resources are easy in the cloud, therefore it is also easy to make **mistakes**
- If governance is not enforced on day 1, deployment of workload could be “too” agile and **remediation** could become very challenging
- Lack of security controls means the **lack of capability to defend against attacks**, as well as to **respond and investigate an incident**

### How

Sample architecture sharing

### Landing Zone – the What, Why and How
